Interview summary: exp_001

(Former P_03 in the focus group)

Fairness

Q: Does the implementation decision described in the statements involve an ethically relevant consideration?

Concerning F2 I believe it is unlikely that a developer intentionally adds extra verification steps without legal or bussiness requirements that force him to do so.
Instead for the others I believe they do involve an ethically relevant considerations.

Q: Do the statements primarily reflect the intended ethical aspect, rather than the others?

Yes

Q: Do the alternative implementation choices in the scenarios differ meaningfully in the extent to which they reflect the ethical aspect?

Yes

Q: Could a developer's response to this scenario provide evidence about their preference regarding the ethical aspect?

I think so as the provided options have a tradeoff between developer and user benefit.

Q: Additional comments (if any)

No further comments

Inclusiveness

Q: Does the implementation decision described in the statements involve an ethically relevant consideration?

Yes.

Q: Do the statements primarily reflect the intended ethical aspect, rather than the others?

Yes, perhaps I2 is also affected by bussiness factors (e.g., do we plan on releasing this for multiple countries or not?).

Q: Do the alternative implementation choices in the scenarios differ meaningfully in the extent to which they reflect the ethical aspect?

Yes

Q: Could a developer's response to this scenario provide evidence about their preference regarding the ethical aspect?

Yes

Q: Additional comments (if any)

Yes, again maybe a little limited regarding I2.

Privacy

Q: Does the implementation decision described in the statements involve an ethically relevant consideration?

Regarding P1 I would assume that a minimum set of information has to be collected for legal and maybe business concerns (such as name, birthdate, gender). Of course more unnecessary information could be collected (like the occupation that you list). So, perhaps the former datums are not the best example.
P3 has a privacy/business perspective tradeoff, as reducing friction during orders likely leads to more orders placed, overall. Also, generally, users are asked of they want to save their address for future orders.

Q: Do the statements primarily reflect the intended ethical aspect, rather than the others?

Yes

Q: Do the alternative implementation choices in the scenarios differ meaningfully in the extent to which they reflect the ethical aspect?

Yes

Q: Could a developer's response to this scenario provide evidence about their preference regarding the ethical aspect?

Yes

Q: Additional comments (if any)

No further comments.

Transparency and Explainability

Q: Does the implementation decision described in the statements involve an ethically relevant consideration?

Who are the stakeholder to which we want to provide transparency/explainability? TE1 and TE2 are more concerned to internal (other devs, testers, colleagues, ...) stakeholders while the others target the end-user.

Q: Do the statements primarily reflect the intended ethical aspect, rather than the others?

Yes

Q: Do the alternative implementation choices in the scenarios differ meaningfully in the extent to which they reflect the ethical aspect?

Yes

Q: Could a developer's response to this scenario provide evidence about their preference regarding the ethical aspect?

Yes

Q: Additional comments (if any)

No further comments

Traceability

Q: Do the statements primarily reflect the intended ethical aspect, rather than the others?

Yes

Q: Do the alternative implementation choices in the scenarios differ meaningfully in the extent to which they reflect the ethical aspect?

Yes

Q: Could a developer's response to this scenario provide evidence about their preference regarding the ethical aspect?

Yes

Q: Additional comments (if any)

No further comments.

Resource Consumption

Q: Does the implementation decision described in the statements involve an ethically relevant consideration?

Yes

Q: Do the statements primarily reflect the intended ethical aspect, rather than the others?

Yes

Q: Do the alternative implementation choices in the scenarios differ meaningfully in the extent to which they reflect the ethical aspect?

Yes

Q: Could a developer's response to this scenario provide evidence about their preference regarding the ethical aspect?

yes

Q: Additional comments (if any)

Yes

Final Questions

Q: Do you think that the proposed five-point response scale is appropriate for expressing the developer's preference regarding the described implementation choice?

I think it's simple but could work. Probably there are better methods but experimentation is needed to understand that.

Q: Do you think that averaging the statements scores is an appropriate aggregation strategy?

I could also see other methods working (e.g., taking the min score) but it's hard to say without evidence.

Q: Should all statements contribute equally to the aspect score?

Idk, it's hard to say that all statements have the same impact.

Authors' summary

- It is unlikely that the developer would chose the options where extra development effort is required (e.g., F2), without requirements demanding it.
- I2 is conditioned by business factors that may drive or constrain the choice
- For P1, some information has to be collected for business concerns, so it is not completely left to the developer.
- P3 represent a tradeoff between privacy and business interests: enhancing the order placement and management for users would likely make the system more used (with more order placed). Also, users may be asked, so the ethical issue is automatically resolved and demanded directly to the user.
- The scenarios (in particular Transparency and Explainability) have ethical concerns that impact different stakeholders (users or other developers)
  Author's response: this reflects the duality of impacts of ethical aspects, which may be both developer-facing and user-facing.
