Interview Summary: dev_003

- 10+ years of experience
- Private company
- Current role: DevOps / Platform Engineer
- Domain of developed software: Transportation / Mobility
- DevOps / Infrastructure / Cloud
- 2-5 developers per team

Structured Questions:

Q: Are the scenario and the implementation choices clearly described?

Yes

Q: Do the scenarios represent a plausible decision scenario?

Some decisions depended heavily on business requirements (e.g., deciding whether or not to support keyboard interactions). I believe engineers shouldn't make these decisions on their own, while others were more technical (e.g., storing order transaction statuses in a database)

Q: Could the scenarios arise across different development contexts?

Yes

Q: Can the implementation choices in the scenarios be driven by the personal preferences of the developer on fairness, privacy, inclusiveness, transparency & explainability, traceability, and resource consumption?

Yes

Q: Did you feel inclined to provide socially acceptable responses rather than express your genuine preferences?

No, some decisions required collecting more user data than necessary, which I don't think is justified.

Follow-up discussion:

Author: You stated that you expected the decision on whether adding keyboard navigation to be already decided by requirements. Do you feel that this invalidated or influenced your choice?

dev_003: I would expect that functionality to be defined within requirements. Anyway, if this was not constrained by requirements, I would decide to support it as a developer, while implementing.

Author: So your choice was not influenced by this expectation, right? …even if you expect it to be within requirements.

dev_002: Yes. Anyway, I think this decision is different than deciding whether and how log errors. Those are things that the developer is usually free to decide.

Author: So, despite the likelihood of having a decision scenario left free for that, the answer provided in the questionnaire still reflects your preference, right?f

dev_002: Exactly, I believe it is still informative

Author's note: the plausibility of the fact that a given scenario is possible (i.e., not being defined within requirements) does not prevent developers from expressing their preference
