Interview Summary: dev_004

- 6-10 years of experience
- Private company
- Current role: Full-stack development, Security
- Domain of developed software: Corporate Welfare
- Team composition: 11-50 developers

Structured Questions:

Q: Are the scenario and the implementation choices clearly described?

No, for some decisions, a bit more information was needed, as those decisions have architectural implications.

Q: Do the scenarios represent a plausible decision scenario?

Yes but depend to the use context.

Q: Could the scenarios arise across different development contexts?

Yes

Q: Can the implementation choices in the scenarios be driven by the personal preferences of the developer on fairness, privacy, inclusiveness, transparency & explainability, traceability, and resource consumption?

Yes they can

Q: Did you feel inclined to provide socially acceptable responses rather than express your genuine preferences?

Yes, but some decisions depend to the context.

Follow-up discussion:

Interviewer: You indicated that you felt inclined to provide socially acceptable responses rather than express your genuine preferences. Could you elaborate on this?

Developer: Yes. In some situations, particularly those involving accessibility, I feel expected to consider implementation solutions that may be disproportionate to the actual needs of the

application. For example, when developing a platform used by only three people, I might still be expected to ensure screen reader compatibility because a visually impaired person could potentially use it, even when I know that all three intended users can access the platform without difficulties. Similar considerations apply to gender-related choices.

Interviewer: To clarify, did you feel pressured to select more ethically desirable responses in the questionnaire, rather than expressing your actual preferences?

Developer: No, that was not the case. My previous answer referred more to the practical and functional implications of certain implementation decisions. I had interpreted the question differently.

Interviewer: So your responses to the questionnaire reflected your genuine preferences rather than an attempt to appear socially responsible?

Developer: Yes, exactly.
